

How to Measure Your Kitchen

What You'll Need: Pencil, Steel measuring tape, Graph paper, Phone or camera

Step 1: Draw Your Floor Plan

Sketch your kitchen using graph paper. Label each wall (A, B, C, D). Measure and write the full length of each wall (corner to corner).

Take photos: Stand in the center of the room and take a straight-on photo of each wall, turning 90° each time.

Step 2: Add Doors & Windows

Measure width and height (include trim). For windows, also measure from the floor to the bottom of the window.

Step 3: Mark Appliances

Measure from the center of each appliance to the nearest wall. Record dimensions if keeping appliances, or provide model info if replacing.

Step 4: Mark Plumbing & Gas

Measure plumbing locations to the nearest wall and label with "P". Note if the drain goes into the wall or floor. Mark gas lines with "G".

Step 5: Mark Electrical

Measure outlets and switches from their center to the nearest wall. Label each with "E".

Step 6: Measure Ceiling & Soffits

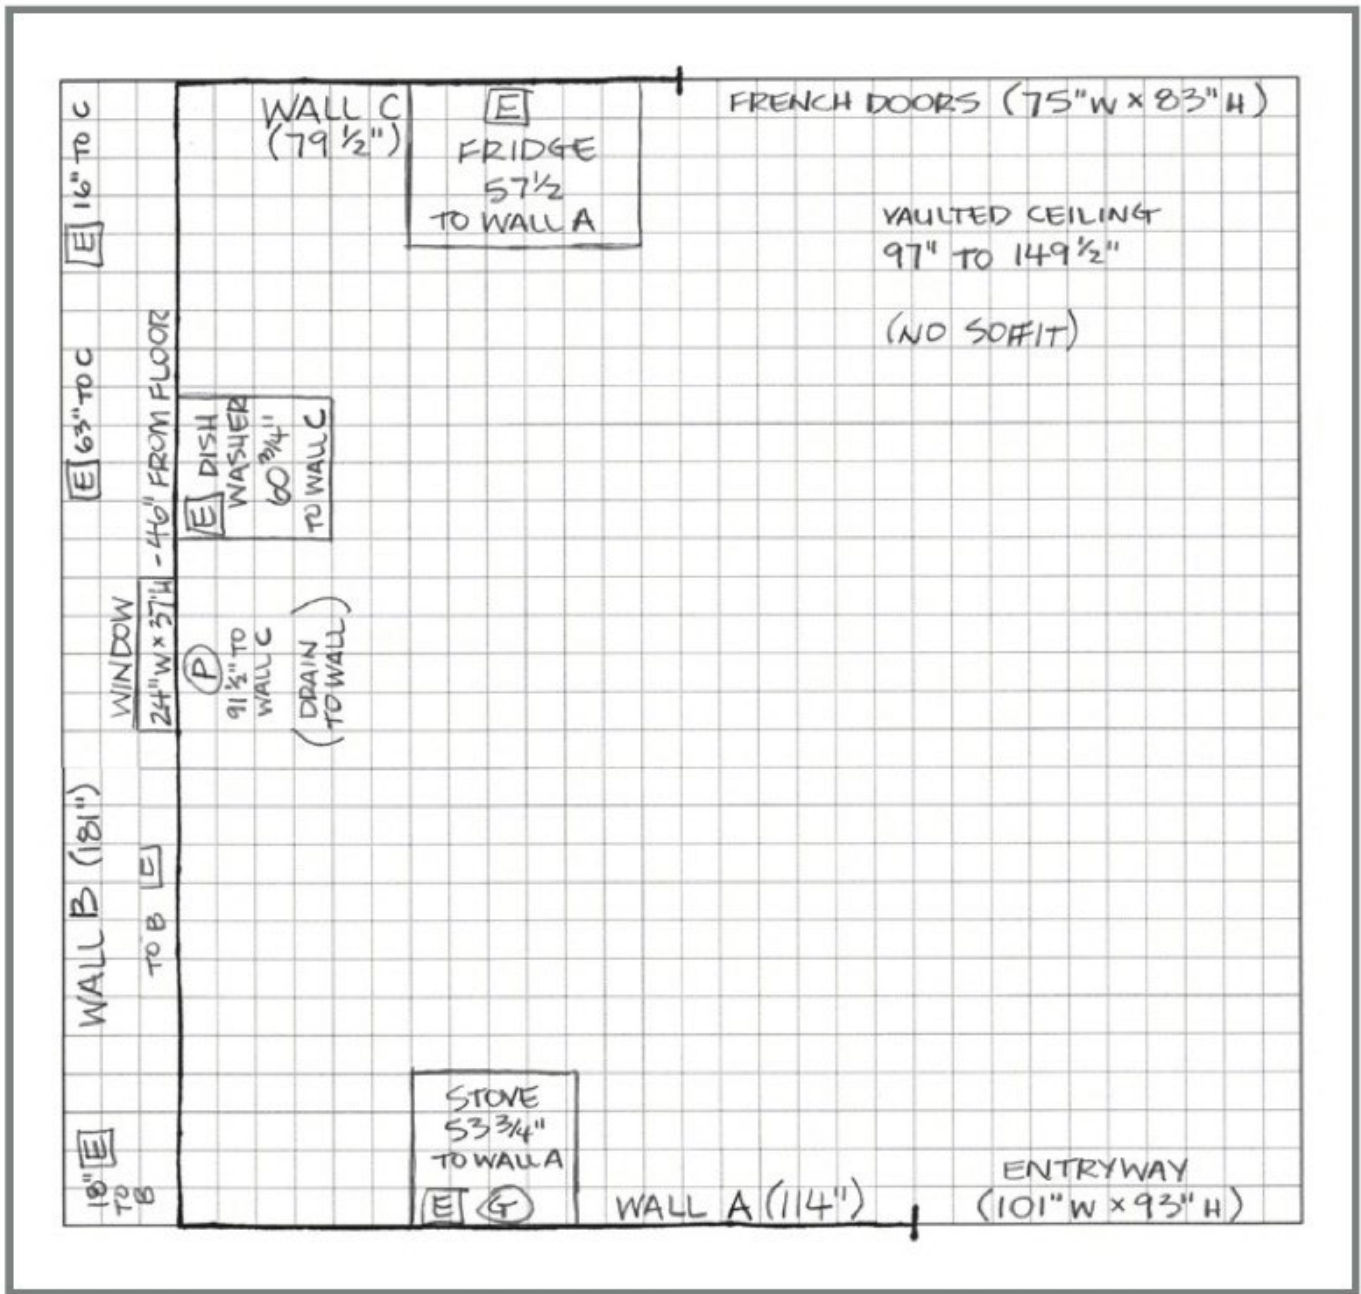

Measure ceiling height in 2–4 spots. If soffits are present, measure their height and depth.

Step 7: Double Check

Ensure smaller measurements add up to each full wall length.

Submit to Cara Saravia, ReStore Manager, via email: csaravia@hkwhabitat.org

Please provide your sketch, photos, and appliance details.

Standard depth for wall cabinets is 12". If you would like a different depth (ex. 24" depth above a refrigerator), please note that in your email.

If you're replacing your existing cabinets with new ones of the same size, you only need to provide the measurements of your current wall and base cabinets.
